BIG DATA PROJECT WORK

Checkpoint 1 Report

Job Posting Review and Individual Skill-Gap Matrix

Team	Team 10
Course / Project	Big Data Project Work – ABDA Skill-Gap Capstone
Selected role	Data Engineer I – Amazon, Job ID 10582732
Source checked	27 October 2026 | Official Amazon Jobs career site

1. Selected Job Posting

Employer: Amazon (ADCI – Karnataka)
Role: Data Engineer
Location: Bengaluru, Karnataka, India
Job ID: 10582732
Official posting: https://www.amazon.jobs/en/jobs/10582732/data-engineer-i

The selected vacancy is published on Amazon's own careers website and names SQL, data modelling, data warehousing, ETL pipelines and scripting as core requirements. The posting asks for at least one year of data-engineering experience. Big-data technologies (Hadoop, Hive, Spark or EMR) and experience with an ETL tool are listed as preferred qualifications.

Team context: the Data Insights, Metrics & Reporting (DIMR) team supports Amazon Warehousing & Distribution through data-engineering/reporting infrastructure, ingestion pipelines, data-sharing mechanisms and data marts. Responsibilities include translating stakeholder requirements into data flows, handling large structured/semi-structured/unstructured datasets, integrating sources, writing maintainable documented code, and implementing unit and integration tests.

2. Candidate Profile Used for the Comparison

The comparison below is based only on evidence visible in the supplied resume. The resume explicitly lists SQL, Python, Excel, data cleaning and wrangling, data validation, data modelling, Power BI and Tableau. It describes work on financial-statement normalization, analysis of 6,000+ financial statements, data-quality controls, reporting automation, and stakeholder collaboration. It does not explicitly document production data-engineering ownership, a named cloud platform, Spark/Hadoop/Hive/EMR, a named ETL tool, or unit/integration test automation.

Rating convention from the project guide: 0 = never heard of it; 1 = know the idea; 2 = used it with help; 3 = can do it independently. Ratings below are provisional evidence-based ratings from the resume, not a substitute for the student's honest self-assessment. Where the resume does not establish proficiency, the rating is deliberately conservative and should be confirmed by the student.

3. Skill-Gap Matrix

Job requirement	Importance	Resume evidence	Provisional rating (0–3)	Gap score	Gap / evidence note
SQL / query language	Must-have (2)	SQL listed under technical skills; used for data analysis and cleaning at NoQs Digital.	2	2 × (3−2) = 2	Evidence of use; independent data-engineering query work is not described in detail.
Scripting language (Python)	Must-have (2)	Python listed; pandas/NumPy and Python-based preprocessing/statistical analysis described in projects.	2	2 × (3−2) = 2	Practical analytical use is documented; pipeline engineering depth needs demonstration.
Data modelling	Must-have (2)	Data modelling listed; Power BI cross-table	2	2 × (3−2) = 2	Some modelling evidence; warehouse-oriented

Job requirement	Importance	Resume evidence	Provisional rating (0–3)	Gap score	Gap / evidence note
		relationships and account classification system described.			modelling is not explicit.
Data warehousing	Must-have (2)	Resume mentions data analysis, reporting and data modelling; no explicit warehouse implementation.	1	2 × (3−1) = 4	Major evidence gap: no named warehouse or implemented warehouse design is shown.
Building ETL pipelines	Must-have (2)	Automated normalization pipeline for financial statements and reporting automation are described.	2	2 × (3−2) = 2	Transferable transformation/automation evidence; end-to-end ETL architecture is not explicit.
Big Data / distributed systems	Role emphasis; preferred tools named	Resume does not name Hadoop, Hive, Spark, EMR or distributed query/storage systems.	0	Not scored as a must-have; assess as a priority learning gap	No direct evidence in the supplied resume.
ETL tool (e.g., Informatica, ODI, SSIS, BODI, DataStage)	Preferred	No named ETL product appears in the resume.	0	Not scored as a must-have; assess as a priority learning gap	No direct evidence in the supplied resume.
Maintainable code and documentation	Responsibility	Automated reporting and audit-ready presentations are described; code documentation practices are not specified.	1	2 × (3−1) = 4	Documentation and maintainability need a demonstrable project artefact.
Unit and integration test automation	Responsibility	Resume mentions data-quality controls, but not automated unit/integration tests.	0	2 × (3−0) = 6	No direct evidence; distinguish data validation from software test automation.
Stakeholder requirements / explaining technical concepts	Responsibility	Cross-functional collaboration with 5+ teams and dashboards for stakeholder decisions are described.	2	2 × (3−2) = 2	Good transferable evidence; requirement-to-pipeline examples could be clearer.

Scoring method: for must-have requirements, gap score = importance × (3 − rating), with importance = 2.
For preferred qualifications or responsibilities that the job ad does not explicitly classify as must-have, the report does not force a numeric must-have score.

4. Top Three Gaps to Close

1. Automated unit and integration testing

The resume describes data-quality controls but does not show automated software tests. The project should add repeatable assertions for schema, nulls, duplicates, value ranges and transformation outcomes, plus tests that validate the end-to-end pipeline.

2. Data warehousing and warehouse-oriented modelling

The resume shows analytical data modelling but no explicit warehouse implementation. The project should define a clear raw-to-clean-to-consumption model and create documented tables that support a real business question.

3. Big-data/distributed processing and a named ETL tool

The job prefers Hadoop, Hive, Spark or EMR and an ETL product; the resume does not list these. Build a practical, appropriately scoped pipeline and clearly document which platform and tools were actually used. Do not claim production-scale experience from a classroom project.

Appendix A. Job Posting Evidence Summary

Basic qualifications stated in the official posting:

- 1+ years of data-engineering experience.
- Experience with data modelling, warehousing and building ETL pipelines.
- Experience with one or more query languages, such as SQL, PL/SQL, DDL, MDX, HiveQL, SparkSQL or Scala.
- Experience with one or more scripting languages, such as Python or KornShell.

Preferred qualifications stated in the official posting:

- Big-data technologies such as Hadoop, Hive, Spark or EMR.
- An ETL tool such as Informatica, ODI, SSIS, BODI or DataStage.

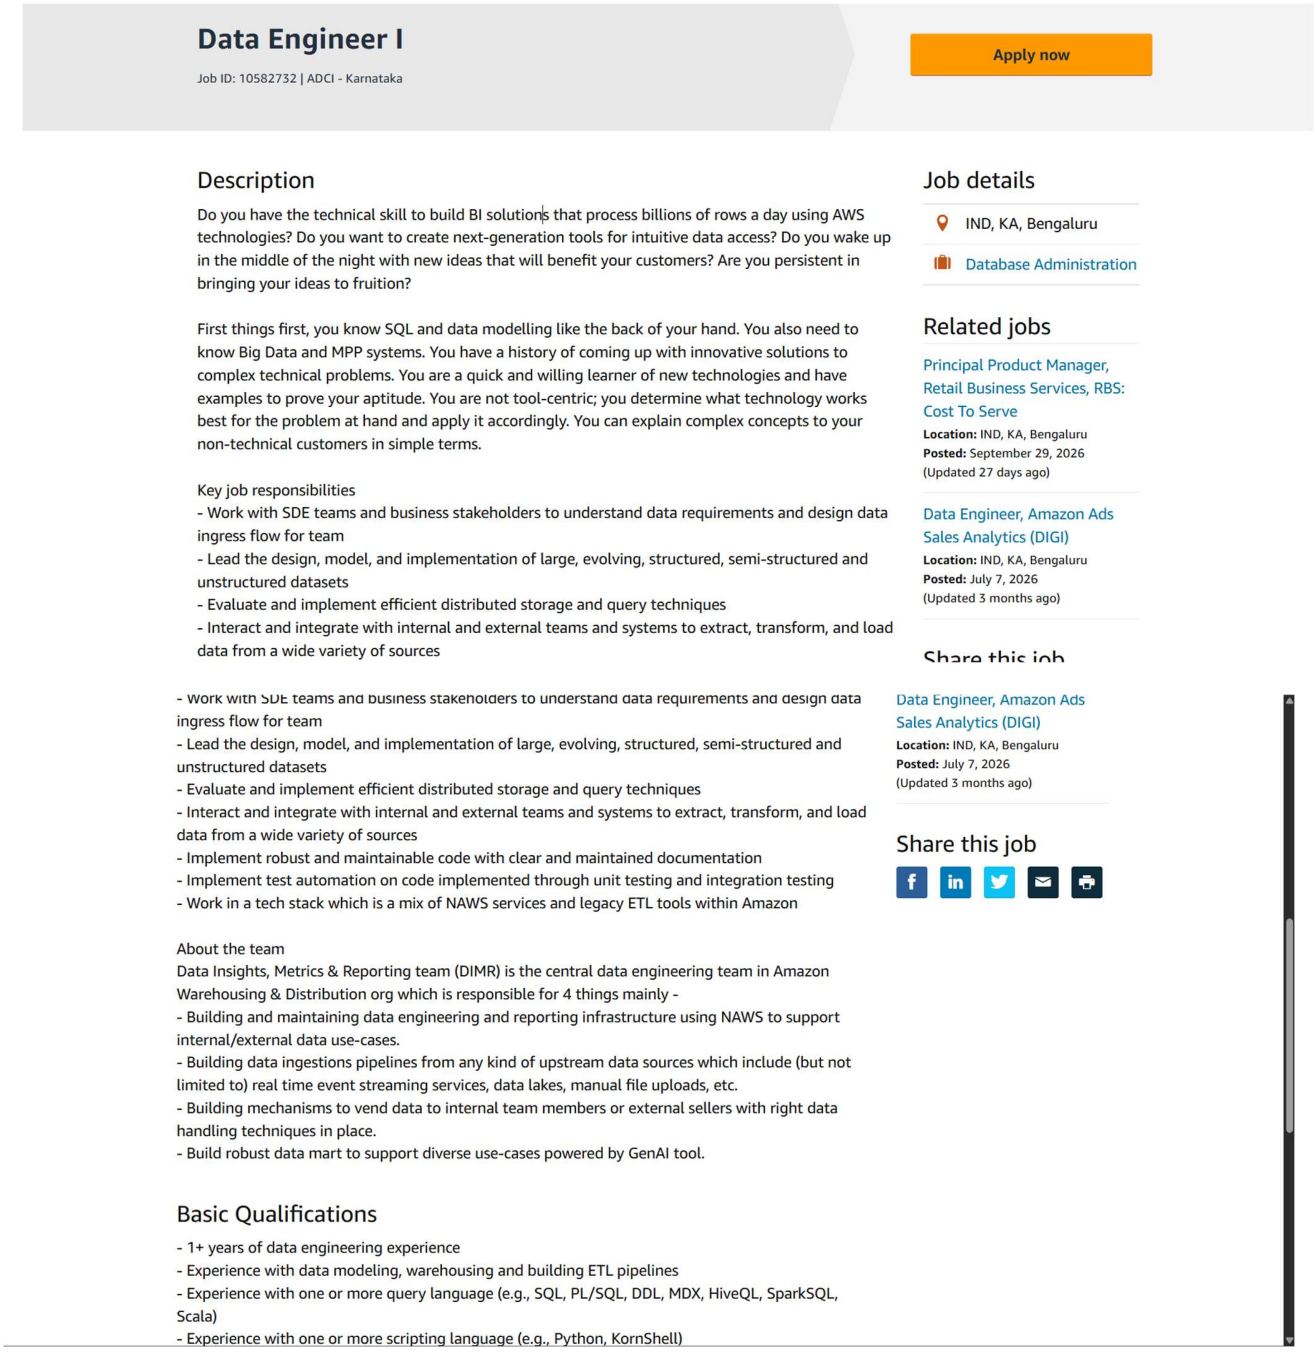

Source note: This summary was prepared from the official Amazon Jobs listing accessed on 27 October 2026. The official listing should be retained separately as a PDF or screenshot for the required saved-copy evidence. This report does not claim that the vacancy remains open beyond the access date.

Appendix B. Official Job Posting Screenshots

Official job posting URL: https://www.amazon.jobs/en/jobs/10582732/data-engineer-i

The following screenshots were supplied as evidence of the job posting. They show the role title and job ID, responsibilities and team description, and basic and preferred qualifications.

Data Engineer I

Job ID: 10582732 | ADCI - Karnataka

Apply now

Description

Do you have the technical skill to build BI solutions that process billions of rows a day using AWS technologies? Do you want to create next-generation tools for intuitive data access? Do you wake up in the middle of the night with new ideas that will benefit your customers? Are you persistent in bringing your ideas to fruition?

First things first, you know SQL and data modelling like the back of your hand. You also need to know Big Data and MPP systems. You have a history of coming up with innovative solutions to complex technical problems. You are a quick and willing learner of new technologies and have examples to prove your aptitude. You are not tool-centric; you determine what technology works best for the problem at hand and apply it accordingly. You can explain complex concepts to your non-technical customers in simple terms.

Key job responsibilities
- Work with SDE teams and business stakeholders to understand data requirements and design data ingress flow for team
- Lead the design, model, and implementation of large, evolving, structured, semi-structured and unstructured datasets
- Evaluate and implement efficient distributed storage and query techniques
- Interact and integrate with internal and external teams and systems to extract, transform, and load data from a wide variety of sources
- Implement robust and maintainable code with clear and maintained documentation
- Implement test automation on code implemented through unit testing and integration testing
- Work in a tech stack which is a mix of NAWS services and legacy ETL tools within Amazon

About the team
Data Insights, Metrics & Reporting team (DIMR) is the central data engineering team in Amazon Warehousing & Distribution org which is responsible for 4 things mainly -
- Building and maintaining data engineering and reporting infrastructure using NAWS to support internal/external data use-cases.
- Building data ingestions pipelines from any kind of upstream data sources which include (but not limited to) real time event streaming services, data lakes, manual file uploads, etc.
- Building mechanisms to vend data to internal team members or external sellers with right data handling techniques in place.
- Build robust data mart to support diverse use-cases powered by GenAI tool.

Basic Qualifications
- 1+ years of data engineering experience
- Experience with data modeling, warehousing and building ETL pipelines
- Experience with one or more query language (e.g., SQL, PL/SQL, DDL, MDX, HiveQL, SparkSQL, Scala)
- Experience with one or more scripting language (e.g., Python, KornShell)
